Journal of Computational Physics

INFORMATION FOR AUTHORS

The purpose of the *Journal of Computational Physics* is to publish articles concerning techniques developed in the solution of data handling problems and mathematical equations, both arising in the description of physical phenomena.

Manuscripts should be submitted to: The Editors, *Journal of Computational Physics*, University of California, Lawrence Livermore National Laboratory, P. O. Box 5509, L-561, Livermore, California 94550, U.S.A.

Only original papers will be considered. Manuscripts are accepted for review with the understanding that the same work has not been and will not be nor is presently submitted elsewhere, and that its submission for publication has been approved by all of the authors and by the institution where the work was carried out; further, that any person cited as a source of personal communications has approved such citation. Written authorization may be required at the Editors' discretion. Articles and any other material published in the *Journal of Computational Physics* represent the opinions of the author(s) and should not be construed to reflect the opinions of the Editors and the Publisher.

Authors submitting a manuscript do so on the understanding that if it is accepted for publication, copyright in the article, including the right to reproduce the article in all forms and media, shall be assigned exclusively to the Publisher. The Publisher will not refuse any reasonable request by the author for permission to reproduce any of his or her contributions to the journal.

Form of Manuscript. Manuscripts should be typewritten with wide margins on high quality 8.5×11-in. bond paper, using double spacing throughout. If larger paper must be used, the text must still be within these dimensions. A minimum of three copies should be submitted; however, in order to expedite handling of manuscripts, five copies are desirable. The original of the manuscript and figures (including computer-generated data) need not be submitted until acceptance, as long as the copies are clear and reproducible. Figures and tables must be in all copies.

Each page of the manuscript should be numbered consecutively. Page 1 should contain the article title, author, and coauthor names with complete affiliation(s). At the bottom of this page should appear the subject classifications and key words (see below). Page 2 should contain a proposed running head of less than thirty-five characters. It should also contain the name and complete mailing address of the person to whom proofs are to be sent. Page 3 of full articles should contain a short abstract.

Notes. Short notes of 10 pages or less (including figures, tables, and references but excluding title pages) regarding the availability of interesting and useful new programs or tabular material will be considered for publication. Letters to the Editor commenting on articles already published in this Journal will also be considered. Neither notes nor letters should have an abstract.

With the exceptions noted below, authors should be guided by the *Style Manual*, 1978, of the American Institute of Physics.

Subject Classification. Authors are required to classify their own manuscripts using the 1980 *Mathematics Subject Classification*, 1985 revision, reprinted from the 1987 *Mathematical Reviews Index* and/or from the additional classifications listed in the January 1989 issue of *Journal of Computational Physics*. Authors are requested to choose at least two categories—one in numerical analysis category 65, and one other (generally a physical classification) from the categories beyond 65.

List of Symbols. If the paper is accepted for publication, it is of vital importance that the author submit a complete list of symbols. The symbols used should be identified for the typesetter **phonetically.** This list will not appear in print but is essential to avoid costly corrections in proof. The author may prepare his or her own list or use a preprinted form supplied by the Editors.

Tables. Number tables consecutively with Roman numerals. Extensive tables will be reproduced photographically and should be typed carefully in the **exact** format desired. Authors will be charged for any new photoreproductions necessitated by changes in proof. Use superscript lowercase italic letters for table footnotes, which should be typed immediately below the table. Type tables at least double-spaced, including titles and footnotes. Do not underline table titles; reserve underlining for text that is to be *italicized.*

Equations. Equations should be typewritten whenever possible and the number placed in parentheses at the right margin. Reference to equations should use the form "Eq. (3)" or simply "(3)." Superscripts and subscripts should be typed or handwritten clearly above and below the line, respectively. Use the exponent $^{1/2}$ whenever possible.

References. References should be cited in the text by a number in square brackets. Literature cited should appear on a separate page at the end of the article and should be styled and punctuated according to the standards of the American Physical Society and using standard abbreviations for journals (see *Chemical Abstracts Service Source Index*, 1985). See the following examples:

1. D. Schnack and J. Killeen, *J. Comput. Phys.* **35**, 110 (1980).
2. I. Gohberg, P. Lancaster, and L. Rodman, *Matrix Polynomials* (Academic Press, New York, 1982), p. 54.
3. R. Gross, M. Koyanagi, H. Seifert, and R. P. Huebener, in *Proceedings, 17th Int. Conf. on Low Temperature Physics, Karlsruhe, West Germany, 1984*, edited by U. Eckern *et al.* (North-Holland, Amsterdam, 1984), p. 431.

For unpublished lectures of symposia, include title of paper, name of sponsoring society in full, and date. Abbreviation of DOE Laboratory report names should follow the style of *Nuclear Science Abstracts.* Give titles of unpublished reports with "(unpublished)" following the reference. Further examples and instructions are available from the Editors.

Footnotes. Footnotes in the text should be avoided if at all possible. If they must be used, identify by superscript numbers and type together on a separate page, double-spaced.

Figures. All illustrations are to be considered as figures. Number each graph or drawing in sequence with Arabic numerals. Supply a descriptive legend for each figure. Type legends double-spaced consecutively on a separate page.

Plan figures to fit the proportion of the printed page. Use a professional lettering set on the original so that the letters and numbers are large enough and "open" enough to take a reduction of 50 to 60% without filling in the ink. Do not include background grids; however, on paper with blue lines the grid can be eliminated in the process of photoreproduction. Identify each figure in a margin with the name of the journal, author's name, and figure numbers; avoid marking the backs of figures.

Proofs. Proofs will be sent to the author with a reprint order form. Authors will be charged for alterations in excess of 10% of the cost of composition.

Reprints. Fifty reprints without covers will be provided free of charge. Additional reprints may be purchased.

New From Academic Press

THE COMPLEXITY OF BOOLEAN NETWORKS

Paul E. Dunne

Since the pioneering work of George Boole on the algebra of logic, the study of discrete functions has had an important place in mathematical research. Work on Boolean functions in particular laid the foundation of a complexity theory which is now recognized as a fundamental concern for modern computational complexity theory.

This book surveys the literature of Boolean network complexity to the present day, providing a comprehensive treatment of the topic. It will be of interest to all concerned with the theoretical foundations of Computing Science and to Discrete Mathematicians.

CONTENTS: Introduction. Combinational Network Complexity. Monotone Network Complexity. Formulae. Bounded–Depth Networks. Planar Networks. Bibliography.

NONSTANDARD METHODS IN STOCHASTIC ANALYSIS AND MATHEMATICAL PHYSICS

Sergio Albeverio, Jens Erik Fenstad, Raphael Hoegh-Krohn and Tom Lindstrom

A Volume in the PURE AND APPLIED MATHEMATICS Series

"This is an outstanding book. It is extremely well-written, one of the most literate mathematics books this reviewer has ever read. The entire book is concise and to the point. It assumes a certain level of sophistication on the part of the reader and for such readers it is superb, a joy to read."

—Frank Wattenberg in
MATHEMATICAL REVIEWS

CONTENTS: **Basic Course**: Calculus. Topology and Linear Spaces. Probability. **Selected Applications**: Stochastic Analysis. Hyperfinite Dirichlet Forms and Markov Processes. Topics in Differential Operators. Hyperfinite Lattice Models. Each chapter includes references. Index.

In Paperback: $34.50/ISBN: 0-12-048861-2
Casebound: $64.50/ISBN: 0-12-048860-4

Textbooks Instructors Read First

The facts on deterministic fractals. By the expert in the field.

FRACTALS EVERYWHERE

Michael Barnsley

Michael Barnsley is inventing the future of deterministic fractal geometry. Now you can read his new authoritative book on the subject of fractals, with revolutionary applications in:

- image compression
- satellite reconnaissance and imagery capabilities
- computer-aided design
- flight simulation
- cinematic special effects.

Handsomely illustrated, including 32 full-color plates, this innovative text is your key to mastering fractal geometry.

1988, 424 pages, $39.95
ISBN: 0-12-079062-9

MATHEMATICS FOR DYNAMIC MODELING

Edward J. Beltrami

From the prepublication reviews:

"It is an exciting book—the only modeling book I enjoyed reading from beginning to end. The author's interest and ability in the area stand out in his writing, and the reader picks up on this right away."

1987, 277 pages, $32.95
ISBN: 0-12-085555-0

CURVES AND SURFACES FOR COMPUTER AIDED GEOMETRIC DESIGN
A Practical Guide

Gerald Farin

The emphasis in this beautifully illustrated text is on the concepts of Bézier and B-spline methods for curve and surface fitting. This book is of interest to software developers for CAD/CAM systems, geometric modelling researchers, and graphics programmers. It has been used successfully as a textbook for university courses and conference tutorials. Problems are included at the end of each chapter.

1988, 352 pages, $39.95
ISBN: 0-12-249050-9

GEOMETRIC MEASURE THEORY
A Beginner's Guide

Frank Morgan

"Morgan's book is a pedagogical masterpiece. It provides a long awaited succinct, comprehensible introduction to the mysteries of geometric measure theory and minimal surfaces that is accessible to readers familiar with basic functional analysis."

—ELLIOTT LIEB

1988, 153 pages, $19.95
ISBN: 0-12-506855-7

Revised and updated...

PARTIAL DIFFERENTIAL EQUATIONS
Second Edition

George F. Carrier and Carl E. Pearson

This is the second edition of the well-established text in partial differential equations, emphasizing modern, practical solution techniques. This updated edition includes a new chapter on transform methods and a new section on integral equations in the numerical methods chapter. The authors have also included additional exercises.

1988, 352 pages, $39.95
ISBN: 0-12-160451-9

ELEMENTS OF DIFFERENTIABLE DYNAMICS AND BIFURCATION THEORY

David Ruelle

Written by one of the eminent researchers in the field, this introductory text presents the elements of the theory of differentiable dynamical systems to students of mathematics and the natural sciences in a lucid and yet rigorous way.

December 1988
c. 192 pages
$34.50 (tentative)
ISBN: 0-12-601710-7
